

## Lifting Equipments:-

### - Hydraulic Bottle Jacks

### Characteristics

- These jacks are mainly used with vehicles fitted with a compressed air tank. They are very compact models. Their monoblock -integrated tank- unwelded construction reduces their dimensions and makes transportation easier. Ideal for work en route.

The MGH series models are fitted with a manual pump and manual release so that they can be operated as a portable bottle jack. Lowering is controlled by adjusting the release valve.

The operator will always be in control of the descent even if the air supply is interrupted.
